

1) Dot Product (2 vectors, 2 matrices, 2 tensors, 2 signals or 2 images)

$$\begin{bmatrix} V \\ 1 \\ 0 \\ 2 \\ 5 \\ -2 \end{bmatrix} \begin{bmatrix} W \\ 2 \\ 8 \\ -6 \\ 1 \\ 0 \end{bmatrix}$$

$$V^T W = 1 \cdot 2 + 0 \cdot 8 + 2 \cdot -6 + 5 \cdot 1 + -2 \cdot 0$$

Dot product is only possible when the dimensions are same.

$$\text{nd } V = \text{nd } W$$

Dot Product in 2D (Matrix) has the same logic

2) Matrix Multiplication

M rows, N columns $\rightarrow M \times N$

$$\begin{bmatrix} M \times N \end{bmatrix} \times \begin{bmatrix} N \times K \end{bmatrix} = \begin{bmatrix} M \times K \end{bmatrix}$$

$$\begin{bmatrix} 0 & 1 \\ 2 & 3 \end{bmatrix} \times \begin{bmatrix} a & b \\ c & d \end{bmatrix} = \begin{bmatrix} 0 \cdot a + 1 \cdot c & 0 \cdot b + 1 \cdot d \\ 2 \cdot a + 3 \cdot c & 2 \cdot b + 3 \cdot d \end{bmatrix}$$

3) Softmax

$$\sigma_i = \frac{e^{z_i}}{\sum e^z}$$

$$z = \{1, 2, 3\}$$

$$e^z = \{2.72, 7.39, 20.01\}$$

$$\sum e^z = 30.19$$

$$\sigma = \{.09, .24, .67\}$$

4) Logarithm : The inverse of "Natural Exponential" e^x

\log is a "monotonic" function of x

$\nearrow \nearrow$
 $\nwarrow \searrow$
 $x \quad \log(x)$

"nonmonotonic" = 

5) Entropy and Cross-Entropy

$$H(p) = - \sum p \log(p)$$

1 probability distribution

$$H(q) = - \sum p \log(q) \quad 2 \text{ " "}$$

$$\hookrightarrow q = (1-p) \text{ " "}$$

: Be cause if's rather yes 1
or no 0

6) min finds the smallest value, arg-min finds where the smallest value occurs.

max finds the highest value, arg-max finds " " " "

$$\min \{1, 0, -1, 2\} = -1 ; \arg \min \{1, 0, -1, 2\} = 3$$

stop
input

1
2
3
4
5
output

1) squirrel : $p=0$

2) speed limit sign : $p=0.5$

3) Stop sign : $p=0.8$

4) Tomato : $p=0.1$

5) Car : $p=0.05$

$$\operatorname{argmax} M(y) = 3$$

np.argmax(pvec) $\rightarrow 2$ (because python index starts with "0").

7) Mean and Variance \rightarrow (varies...)

average
sum / len(n)

$$\sigma^2 = \frac{1}{n-1} \sum_{i=1}^n (x_i - \bar{x})^2 \quad \text{"mean center"}$$

Failure Scenario

8) Random Sampling - Sampling Variability

\rightarrow Take lots of samples. (true population mean)

8) Seed Function (Reproducible randomness through SEEDING)

When you set a random seed, it ensures that the random numbers generated by the algorithm are the same everytime you run the code. This is important for debugging + understanding the model behaviour as it allows you to recreate the exact same conditions in diff. runs.

9) T-TEST

$$H_A = \text{blue circle}$$

$$H_B = \text{green circle}$$

$$H_0 = H_A = H_B$$

equally well

$$t_k = \frac{\bar{x} - \bar{y}}{s/\sqrt{n}}$$

T-test = a statistical hypothesis test used to determine if there is a **significant** difference between the means of two groups or populations. Used generally when you have a small sample size and want to assess whether the means of 2 groups are different.

10) Derivatives → find the smallest error for the best solution.

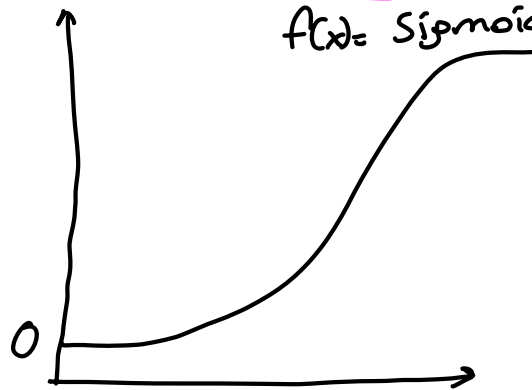

$$f(x) = \text{ReLU}(x)$$

↓ df

$$f(x) = \text{Sigmoid}(x)$$

↓ df

$$f(x) = x^2$$

→

$$df = 2x$$
